Thanks a lot for your response .

However , it does not resolve my issues. I would like to compare mean values of a given variable Y over time 2005, 2007-2008, 2010 by district. However, districts values contained in shdist are not the same in 2005 (11 districts), 2007-2008 (10 districts) and 2010 (30 districts).
If take the current 30 districts as my reference geographic unit, on which basis could I affect enumeration area of the 2007-08 and 2005 survey in these 30 districts ?
Many thanks in advance
ac
