Following is a response from DHS Research & Data Analysis Director, Tom Pullum:

You scored this variable to be either 0 or -1? Do you mean 1 and 0? Usually a binary variable is coded 1 for yes and 0 for no.

The mean of a binary variable x is the proportion of cases that are coded 1.

If you want to get that proportion (or the mean of x) within clusters the command is "egen $X = \text{mean}(x)$, by($v001$)". The PSU is given by $v001$ or $v021$.
