Following is a response from DHS Research & Data Analysis Director, Tom Pullum:

The ARI variable is constructed from h31, h31b, and h31c in the KR file. The Stata code to do this is located online on our GitHub side. There is a link to that on the DHS user forum homepage. (See the lower left corner of <https://userforum.dhsprogram.com/>.) We emphasize that the indicator only refers to symptoms of ARI. It is not a diagnosis of ARI.
