Following is a response from DHS Research & Data Analysis Director, Tom Pullum:

I was able to get a match by merging with the PR file and then selecting the women for whom hv117=1 (for men you would select on hv118=1). These are the women (and men) who were eligible for the individual interviews, whether or not they were actually interviewed individually.

I tried this because the biomarkers are part of the household survey and the covariates in the table are part of the household survey. However, your approach--merging with the IR file (and MR file) was completely reasonable, and the differences are very small.

set more off

use "C:\Users\26216\ICF\Analysis - Shared Resources\Data\DHSdata\ZAAR71FL.DTA", clear

rename hivclust hv001 rename hivnumb hv002 rename hivline hvidx

sort hv001 hv002 hvidx save e:\DHS\DHS\_data\scratch\ZAARtemp.dta, replace

use "C:\Users\26216\ICF\Analysis - Shared Resources\Data\DHSdata\ZAPR71FL.DTA", clear

keep hv001 hv002 hvidx hv024 hv104 hv105 hv117 hv118 sort hv001 hv002 hvidx merge hv001 hv002 hvidx using e:\DHS\DHS\_data\scratch\ZAARtemp.dta

tab \_merge keep if \_merge==3 drop \_merge

tab hv024 [iweight=hiv05/1000000] if hv117==1
