Hello! I have an appended dataset that contains 10 countries that have the domestic violence module. In order to study the determinants of seeking help, i need to run a regression with seeking help as the dependant variable and some explanatory variables. I have 10 countries and for each country there is 2 years of data, however its not panel data its cross sectional data. My advisor told me i should pool the countries together and run fixed effects but i only know how to run separate regression for each country. How can i do that? how will my regression equation be?
