Following is a response from DHS Research & Data Analysis Director, Tom Pullum:

For each survey you can construct "stratumid" using whatever was specific to that survey. Then for the pooled file, "egen stratumid_all=group(stratumid survey)".

The clusterid is v021 (=v001) in each survey. You would have a separate command such as "egen clusterid_all=group(v021 survey)".

Then in the svyset command you put "clusterid_all" and "stratumid_all" in the appropriate position. Of course, the names you give these ID codes is up to you.
