Following is a response from DHS Senior Sampling Specialist, Mahmoud Elkasabi:

Yes, your approach is correct. You need to de-normalize v005 and mv005 separately as you described, then you can proceed with Step 2. However, I believe the code you shared is missing the de-normalization for the men weights. See a revised code below.

adjusting weights of men and women in combined dataset gen newwt =. replace newwt =(v005/1000000) (xxxxxxx/29461) if sex==2 replace newwt =(mv005/1000000)* (yyyyyyy/10760) if sex==1

*Step 2. Approximate the Level-2 weight * f the variation factor

T the variation facto

.....
