Hi! My name is Yves Sanley.
I am working on a study about the factors associated to HIV prevalence in Haitian women from 15 to 49 years old between 2016-2017. I would like to merge the HIV test results and the sociodemographic and cultural variables of these women to assess possible associations. I am confused with the recoding document.
Can someone help me with the command I should use, using the software R to have these data available?
