Following is a response from DHS Research & Data Analysis Director, Tom Pullum:

Tables 3.8.1 and 3.8.2 in the Indonesia 2012 report were prepared in CPro. The code is included in the attached text file. The table numbers may be different. I hope you can figure out the logic and convert to SAS. Note that it is possible to have more than one type of insurance. The table columns are sequenced with v481c, v481b, v481d, v481x. Note also that "None" includes cases with v481 coded "0" or coded ".". (Considering those two codes to be equivalent is unusual.) The variable prefix is v for women and mv for men.

Let us know if you still have difficulty matching the tables.
