Greetings,

I am working on birth spacing using Bangladeshi DHS. For this I am trying to calculate survival status and sex of the preceding child. However, I could not find the variables indicating the survival status and sex of the preceding sibling. There are couples of related questions discussion over this issue in the DHS forum, however, I did not find these as helpful to solve my issues.

Any help in this regard (variable name or derivation code in Stata) will be much appreciated.

Thank you,

NK
