Dear Tom Pullum,

Many thanks for your quick and clear response. However, the codes you sent did not solve my issues though they were quite helpful.

I am using 2017/2018 Bangladesh Demography and Health Survey data. Variable b11 in the KR file of BDHS represents preceding birth interval where 5318 response was recorded. I need sex and survival status for each of the child included to generate b11 variable, i.e-

1. Sex and survival status of the last child (variable b4 and b5 in the KR file)
2. Sex and survival status of the childs with whom the last childs were compared to generate b11 variable

Thanks in advance!

Regards  
NK
