Following is a response from DHS Research & Data Analysis Director, Tom Pullum:

If you require that $v208=1$, then you are selecting children whose mother had only one birth in the past five years. The child with $bidx=1$ will be that one child. In the KR file, there won't be any other children with the same mother. That child will definitely have $b0=0$, that is will be a singleton. Any other value of $b0$ for the most recent child would imply that the mother had MORE THAN ONE birth in the past five years. That is, the requirement that $b0=0$ is superfluous.

I guess I don't really understand what is your intended sample. Can you answer yes or no to the following three questions? (1) Child must be a singleton? (yes/no). (2) Child must be the only child born in the past five years? (yes/no). (3) Must be the most recent birth? (yes/no). Thanks!
