Hi

I am trying to check the impact of water sanitation and hygiene on child health(diarrhea, stunting, wasting ). Should i use the PR file and how to select only the de facto children.

Should i use PR file only or other files too for merging ? As i want to find relationship between child health and other household characteristics (Water, Sanitation, mother age & education, father age & education, number of households, nutritional knowledge of mother, decision making of mother, breastfeeding). I need assistance regarding which file to use for above variables and which variables do i need to generate and which are already available in data files.
