Dear,

Thank you so much for your kind advice. it's truly helping me a lot!

To summarise, I will use mv005 as weight for the subsample of wives, and the subsample of husbands. Since variable D121 (wives) / SM716 (husbands) is asked in the Domestic Violence Module, and needed as a control variable in the binary logistic analysis, I should use d005 as well right? So I've 2 weights to account for. Moreover, I also incorporate the state variable in the analysis, suggesting I'll also need the 'state men's sample weight' (mv005s). Leaving me with 3 possible weights to account for, how am I to do this in SPSS, that only allows to take 1 weight into account via DATA -> WEIGHT CASES or via the complex sample package.

Kind regards,  
Zoë Carette
