Hello, I tried to analyze the pre marital sex among young adult . At first I used MR data set but all the sample count as married or living with spouse. Then, I am using the special data set IDML7AFL. I tried to calculate it and compare my finding with the adolescent report but it comes out different. Can anyone explaine what is special data set and what should I do to get the same result as the report?

Is there any special treatment when using the special data set?
