Dear All,

I would like to conduct a multilevel analysis using IDHS 2017. I have constructed several community variables, such as the community poverty variable by aggregating individual values into community/cluster values. However, when I want to construct cluster-level weights I couldn't find the average number of households in the enumeration areas, per region, and type of place of residence (urban and rural). My question, how to construct the cluster-level weight without that information?

Thank you

Best
