Dear Bridgette and Tom Pullum, Thank you very much for your attractive response!! I am using Stata for analysis of predictors of neonatal mortality in Ethiopia using 2019 Ethiopia Mini Demographic and Health Survey data. So, How can I extract the data for newborns in the last five years from the ETBR81FL.DTA dataset? I need to have the exact sample size of neonates in the five year period preceding the survey including twins? From 2019 Ethiopia Mini DHS, figure 6.1 indicates the neonatal mortality rate showed as 33 deaths per 1000 live births. How can I get it, Stata command for this issues? How can I get the total number of live births 5 year period preceding the survey? How can I create the dichotomous variable for Neonatal mortality as 1 if dead, 0 otherwise with Stata command?

With Kind Regards, Hassen A.
