Dear DHS Experts, How are you my best? I am using Ethiopia ETKR81DT dataset and Stata 14/SE for analysis to explore predictors of Neonatal Mortality (coded as yes=1, no=0). I need your help on: How can I generate a Single Variable called High-Risk Birth (coded as: "Births not in any high risk category", "Birth with any single high-risk category", & "Births with any multiple risk category") from High-Risk Fertility Behaviors(HRFB) Parameters? Any code for Stata?

Cheers, Hassen
