Dear,

I am trying to reproduce table 2.4 from Bangladesh Health Facility Survey 2017 in Stata. Would it be possible to get the code?

Also, it is mentioned in the report that these background weights are also considered when data analysis was done for the various domains, may I please get an example code for percent distribution calculation where the weight is used (for example, table 3.2) - just to understand how to include information of weight in the analysis.

Thank you!
