Hi,

I'm not familiar with the DHS surveys. I'm working to reproduce a methodology to calculate the wealth index from 43 DS surveys using the PCA. (Households) using 11 attributes? (Rooms per person, Electricity, Floors, Water, Toilet, Phone, Radio, Tv, Car, Motorbike, Fridge).

My question is how to select them from the surveys? I want to extract the recode file for each variable (Floors.dta, Tv.dta, etc.).

Thank you in advance for your help.

ABA
