Following is a response from DHS SPA Specialist, Rajendra Dangol:

Following is the CsPro logic on how we created these variables. Actually, these variables are coming from the provider level to facility-level file after counting the providers and transferred x2002a as z2002a, x2002b as z2002b and so on. Hope this helps.

```
superv=(P801 in 1,2);
if modtmpfp or sterfp then
  if P400=1 then
    x2002a=x2002a+1;
    x2002b=x2002b+(count(P403000 where P403=1)>0);
    x2002c=x2002c+superv;
    x2002d=x2002d+((count(P403000 where P403=1)>0) & superv);
  endif;
endif;
```
