Dear Sir/Madam

I have one question that I believe you will clarify to me:

I am using the new release of Ethiopian DHS-2019, mainly KR file.

I am interested in children's nutritional status for this I merge it HR and KR files.

Using v001 v002 as a key identifier. But When I tab anthropometry [iw=weight]

I repeatedly get no observation.

Could you please let me know how to appropriately merge the children anthropometry index from

HR to the KR file

so I can tab with weights?

Kind regards

ZF
