Subject: Issues with weighting NEW Ethiopian DHS-2019

Dear Sir/Madam
I have one question that I believe you will clarify to me:
I am using the new release of Ethiopian DHS-2019, mainly KR file.
I am interested in children's nutritional status for this I merge it HR and KR files.
Using v001 v002 as a key identifier. But When I tab anthropometry [iw=weight]
I repeatedly get no observation.

Could you please let me know how to appropriately merge the children anthropometry index from HR to the KR file
so I can tab with weights?

Kind regards
ZF
