Dear Shireen,

I just want to say thanks a lot! I had already figured out that the penta variable changed, however, I think the main problem was dropping $h1 == 0$. THANKS SO MUCH FOR THIS! I really appreciate it.

I just want to ask one last thing which will be the cherry on top if I can get a solution. I am struggling with exporting the weighted dataset into R, or simply saving it as a new dataset. If I can do this, it will make my work so much easier because I am using R for the tables and visualizations. Therefore do you have any suggestions on how to save a weighted dataset as a new dataset, which will contain the population estimates?

Please let me know.

Kindest regards
