Thanks Shireen.

I would like to ask one more thing. Most of the recent DHS surveys (e.g. Tajikistan 2017) use a different categorization for "all basic vaccines". BCG, Polio and DTP are considered for children 12-23 months and measles is considered for children 24-35 months.

How does the code change based on this categorization?

I assume that is why on Table 11.3 pg 149 in the final report (<https://dhsprogram.com/pubs/pdf/FR341/FR341.pdf>), all basic vaccinations for 12-23 months is N/A?

Best regards
