Hello,

In this case you can use the KR file and use the anthropometry variables hw70, hw71 and hw72. You can code stunting for instance in the same way by replacing hc70 with hw70 and remove the hv103 condition. You would use the weight v005 and divide by 1000000 as done below. There is no need to create a weight variable.

Best,
Shireen
