After I dropped the pregnant women and those with less than 2 month old birth, i categorised the BMI variable:

```
gen bmic=1 if bmi<18.5
replace bmic=2 if bmi>=18.5 & bmi<25
replace bmic=3 if bmi>=25 & bmi<30
replace bmic=4 if bmi>=30 & bmi<60
label define bmic 1"Underweight" 2"Normal" 3"Overweight" 4"Obese"
label values bmic bmic
```

When I ran the frequency of the categorized BMI, I am getting figures that are different from what is stated on the report. What did I not do right?

```
tab bmic [iw=wt]
```

```
      bmic |      Freq.   Percent   Cum.
-----+-----
Underweight | 1,670.6812    11.35    11.35
   Normal | 8,912.747    60.54    71.89
Overweight | 2,703.0016    18.36    90.25
   Obese | 1,436.16     9.75   100.00
-----+-----
      Total | 14,722.59   100.00
```
