Subject: How is sampling done for child development and child diet?

Hello DHS forum,

I'm working with several DHS datasets to examine the associations between child development and diet in children 36-59 months of age. Both child development and diet are not collected for all children in this age range. I'm trying to find information on how children are sampled for these two assessments. Since both are optional, there seems to be virtually no information on the DHS website or in final reports.

Thank you!

Lily
