Dear Bridgette,

That makes a lot of sense now. Thank you so much!

Just one more follow up question.

My analysis would involve participants with complete data (without missing values) and one of the key variables is domestic violence. If that is the case, could I simply have the participants with the complete data without any missing values in outcome variables or any other covariates and use d005 for the weight?

Thank you so much for your support. It has been really helpful!
