Dear DHS officers,

Cambodia DHS 2014 report said that a micronutrient survey was carried out with one in every six of the cluster. The micronutrient survey collected data on blood level of vitamin A, vitamin B12, vitamin D and calcium for mothers and children. I looked for these variables but could not find them. I could find blood level of hemoglobin in IR and PR recode files but not blood level of these micronutrients. I checked "Guide to DHS" website but could not find the information either. Could you please help guide me which recode files have this data and which variable name they are?
Thanks so much!

Minh-Cam Duong
