I am pretty new at analysing ASFR and have used standardised packages such as TFR2 from Stata and DHS.rates in R to replicate results that was obtained in the Ghana Maternal Health Survey report. The results that i obtain are inconsistent with what is contained in the report. For example

Results from report by residence

| Agegrp | Urban | Rural | Total |
|---|---|---|---|
| 15-19 | 57 | 95 | 75 |

Results Obtained

| Agrp. | Urban | Rural | Total |
|---|---|---|---|
| 15-19 | 28 | 37 | 32 |

I hope to have the support to help me figure out why I am not having consistent results. Thank you in advance.
