Hey,

Thanks for the help.

I am using the DHS data for the first time and analyzing it with SPSS program, which is also new to me.

So I would like to get detailed info in a simple way. How can I merge the IR and PR together using SPSS, so that I can use the information about the specific person having disability, connect that person in the household and connect all the information about that person on Women's questionnaire (for example contraceptive method knowledge and usage). So in that case I would use only women respondents.

Thank you!
