Hi all,

I am currently struggling to find a way to link individual demographics to the hepatitis C blood sample results in the 2008 survey. In the specific dataset that contains the hepatitis C results, EGOD5ADT.dta, only the cluster number, household number, and line number are provided, none of which are usable immediately to determine demographics of those that tested positive or negative (other than their cluster GPS coordinates). Does anyone know of a way to find a possible link here to individual IDs?
