Dear Expert,
While merging PR to KR file (for example, average years of education of the household, number of elderly in hh, number of youth in hh, etc),
Is it possible to merge with KR without lose of cases? if so how in Stata? I've successfully merged but I lost a few cases (equivalent to the number of dead children). And when using death as an outcome and those variables as an independent variable, no coefficient estimate emerges.

Kind regards,
