I do not see a SPA section in the user forum , but will post here since this question relates to malaria diagnostic testing in SPA sick child observation.

The Malawi SPA preliminary report is now available, but not the specific SPA questionnaire for Malawi. Was the sick child observation revised to record the result of the malaria diagnostic test, and if so, how is this done? Any info you could provide would be greatly appreciated.

Also, when is the final report and dataset expected to become public?

With many thanks

Emily
