Subject: Penta1 to measles dropout
Posted by adis on Sat, 07 May 2022 20:35:50 GMT

We are exploring the 2019 mini Ethiopian DHS data set and we have created penta1 to measles dropout using formula in STATA. However, after generating the new var the, third category was created with a label of negative number. We cant figure out why that was happened? would you please help us solve this problem?

********the stata command we used was

gen penta1_ms_Drop= DPT1-ms

label define penta1_ms 0"Not dropped" 1"Dropped"
label val penta1_ms_Drop penta1_ms_Drop

what command should be used to overcome the negative number?

thank you for your swift response
