Following is response from DHS Research & Data Analysis Director, Tom Pullum:

The following lines should match the reports, where teenft is calculated as in your other forum question about Pakistan:

gen wt=v005/1000000
svyset [pw=wt], psu(v021) strata(v023) singleunit(centered)
gen awfact = awfactt/100
svy: ratio teenft/awfact

If you want to do this within subpopulations, you should use other versions of awfact, such as awfactr, that are in the data files and are described in the Guide to DHS Statistics.
