Thank you shireen

we actually checked the information you gave us on June 6.

From the definition of our dropout : there are dropout and dropout rates

to know the number of children drop out from the Vaccination we either use the difference between (Penta1 and Penta3) or (penta1 -Measles). When we do this, the expectation is those unvaccinated children shouldn't be part of the analysis. When we use rate/ratio; the previous formula you gave us worked but when it is simply the difference between the above mentioned vars the values reported are completely different.

I don't know where we made a mistake

I know we are taking your time but we really got interesting information that guides our analysis.

I hope you will have a finale say

Thanks
