Following is a response from DHS Research & Data Analysis Director, Tom Pullum:

In the PR file, hv003 is the line number of the household respondent. It is the same for everyone in the household because it identifies the one person who answered the questions in the household interview. The line number of individuals in the household is hvidx. For children, the line number of the mother is given by hv112. I can't be more specific because you didn't say what survey you are using that has an "Other Biomarkers" file.
