Thank you fo this answer

I also wanted to ask you about the code to compute the mortality rates. I want to get the maternal mortality rates. I saw that there were many programs. Do I have to run them all or only some of them? By the way I encounter some issues to run the 2nd program (set up adult mm_vars). Stata doesn't find lw and spath for example. What does it refer to?

I managed to run the 1st program but I don't understand its utility.

Thank you
