I'm looking at IR files for ht/age standard deviations for the births that have happened in the last 5 years. I'm using variables hw5. However, unlike other rounds, I find that for DHS India 1998-1999, records are available in IR file for only the last 4 births in the last 5 years, instead of 6 births.

Were data collected on only the last 4 births in that round? All other rounds have information on 6 births.
