---

I am trying calculate stillbirth using calendar data following the given example-

<https://www.dhsprogram.com/data/Calendar-Tutorial/index.cfm# example4>

However, while calculating stillbirth for Philippines, I could not find the variable called vcal\_1. Is there any way to calculate stillbirth without using the vcal\_1 variable?? I guess there must be a solution as there are estimates in the report. Please help me out.
