Subject: Stillbirth calculation for Philippines Posted by Mihir on Tue, 25 Oct 2022 07:24:46 GMT View Forum Message <> Reply to Message

I am trying calculate stillbirth using calendar data following the given example-

https://www.dhsprogram.com/data/Calendar-Tutorial/index.cfm# example4

However, while calculating stillbirth for Philippines, I could not find the variable called vcal_1. Is there any way to calculate stillbirth without using the vcal_1 variable?? I guess there must be a solution as there are estimates in the report. Please help me out.
