---

I am trying to use the PR data set to analyse where do people with disability visit for seeking health care by type of disability.

sh73= when members of your household get sick, where do they generally go for treatment.

sh31=does any member of this household including you have any disability?

However, there are six variables for each person variable! example:

sh33a1a

sh33a1b

sh33a1c

sh33a1d

sh33a1e

sh33a1x

and there are four similar sets a, b, c, d.

Not sure how to move forward.

Please help

Regards

Lincoln
