You need to use the survey weights to get the DHS report numbers. See the FAQ under "using data files"

http://dhsprogram.com/faq.cfm

Here is some example code for setting up the weightts, and then you would want to use "svy: tab stunted" to calculate stunting rates.

Example Stata code:

\*generate weight

generate weight = v005/1000000

\*make unique strata values by region/urban-rural (label option automatically labels the results) egen strata = group(v024 v025), label

\*check results tab strata

\*tell Stata the weight (using pweights for robust standard errors), cluster (psu), and strata: svyset [pweight=weight], psu(v021) strata(strata)
