Dear all,

I need some guidance on this

My results for frequencies for the variables M49A\$1 and ML1\$1 which relate to women age 15-49 with a live birth in the 2 years preceding the survey who, during the pregnancy resulted in the last live birth, received one or more doses of SP/Fansidar, received two or more doses of SP/Fansidar, and received three or more doses of SP/Fansidar differ from results in the final Nigeria MIS 2021 results.

I am using SPSS drop-down functions not syntax window in the analysis.

I have applied the appropriate weight variable.
