Thank you, Tom.

I have some doubts.

1. In the below codes, don't we care about the missing values?

```
local ltypes "head_male head_female husband wife fa mo fa_inlaw mo_inlaw"  
foreach lt of local ltypes {  
egen n_`lt'=total(`lt'), by(hv024 hv001 hv002)  
}
```

2. When I'm doing this tabulation `tab head_type hv101`, I'm getting the output in the attached image. Below this particular tabulation, you have written "There should not be any cases with `head_type=1` or `3` and `hv101==2`". Accordingly, I should not be getting 4 in the wife or husband column, right?

Can you please explain it?
