Following is a response from Senior DHS staff member, Tom Pullum:

I just looked at the report, including the appendix with the questionnaire, and the IR file. Questions 430 and 431 are about whether the woman smoked cigarettes while pregnant, and if so, how many per day. There are responses only for the most recent pregnancy, and smoking was rare. Less than 2% of women say they smoked during the most recent pregnancy. Otherwise, all the variables about smoking (v463*) are NA for all cases.

You suggest that the report includes information about tobacco use, but I don't see it. Can you be more specific about where you see this in the report?
