Hi, I am trying to get district level estimates/proportions of variables related to norms, domestic violence etc. NFHS-4 and NFHS-5 mentions that these variables are not representative at the district level. Is there any way around this problem ?

Subject: Re: Norms variables [[URGENT]] Author: niruj Date: Mon, 27 March 2023 05:22

I tried to get district level proportion for the variable s930 (has a mobile phone that respondent uses). I used the svyset and svy command. Results show the mean by district, but standard errors and confidence interval are missing. Stata produces a note: [Note: Missing standard errors because of stratum with single sampling unit.]

The code I used. (tried both ways of generating stratum.)

```
* generate stratum  
gen stratum = v023
```

```
* alternative strata based on region and urban/rural  
* egen stratum = group(v024 v025)
```

```
gen wt = v005/1000000  
svyset v021 [pw=wt], strata(stratum)  
svy: mean s930, over(sdistri)
```
