Dear Expert,

I am working on the study about women education on fertility 2017-2018 Pakistan data. I need to analyze the variable, total number of children ever born (BR file) with women education attainment and other characteristics of women in the IR file. I want to merge IR file which contain ever married women with the BR file because I need total children ever born to analysis with women characteristics.

OR need to merge these variables v149 (IR file), v024 (IR file), v013 (IR file) with the v201 (BR file).

Kind regards.
